

Genesis Yapco

Yapco Cam Stabilizer is an inertial image stabilizer that eliminates hand shake when shooting with a camera or a light camera. It is an easy and convenient tool intended for both professional cameramen and beginner filming enthusiasts regardless of their level of advancement. Thanks to the large configuration possibilities and the precise change of center of gravity position, the stabilizer can be successfully used for filming with cameras and cameras weighing up to 2.2 kilograms.

Yapco Cam Stabilizer is equipped with a quick assembly plate, the position of which is regulated in two axes by means of guides. Additional balancing of the equipment is made by changing the angle of the counterweight deflection, which if necessary can be weighted by means of the weights included in the set. The stabilizer is made of steel and light aluminum alloys, which makes it an excellent compromise between the convenience of use and the preservation of high stabilizing potential. To ensure high comfort of work with the stabilizer, the handle is covered with a soft foam, which ensures a safe and ergonomic grip in all weather conditions.
